## Know your weight!!

What's your mass?
Now calculate your mass in Kg's
Now calculate your weight in Newtons (N):
Weight $=$ your mass $\times$ gravity; for example $75 \times 10=750 \mathrm{~N}$

|  | Jupiter's gravity $=26$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | Weight = | $\times$ | $=$ | $N$ |
| 30 | Our Moon's gravity $=1.6$ |  |  |  |
|  | Weight = | $\times$ | $=$ | $N$ |
| 0 | Mercury's | gravity $=4$ |  |  |
|  | Weight = | $\times$ | $=$ | $N$ |
|  | Pluto's gravity $=20$ |  |  |  |
|  | Weight = | $\times$ | $=$ | $N$ |
|  | Saturn's gravity $=11$ |  |  |  |
|  | Weight = | $\times$ |  | $N$ |

- Where above would you feel 'weightless'
- Where above would you feel 'heaviest'
